homogeneous catalysis is an important strategy for the synthesis of high valued chemicals L brandsma has carefully selected and checked the experimental procedures illustrating the catalytic use of copper nickel and palladium compounds in organic synthesis all procedures are on a preparative scale make economic use of solvents and catalysts avoid toxic substances and have high yields

polar organometallic compounds are indispensable for the synthetic chemist as this book shows these almost ideal reagents are easy to prepare with high specificity under mild conditions and yet react quite readily with a great variety of substrates many compounds can be metallated directly at positions which would otherwise be difficult to substitute functional groups and heteroatoms already present in a molecule direct metallation to sites in their vicinity the rules which govern polar organometallic chemistry often are not dominated by the usual  $n$  delocalization and inductive effects dipolar interactions chelation polarization etc often can be much more important this affords novel synthetic opportunities a good example is the development of a basically new type of aromatic substitution chemistry not based on positively charged intermediates seebach's injunction thinking of polar organometallic compounds as carbanions is an impoverishment rather than a simplification international symposium chemistry of carbanions durham 1984 stresses the need to consider the metal not only as an integral but perhaps also as the key component of these reagents rather than wandering off as solvated cations and acting as uninvolved spectators the metals rather than the anion moieties can initiate and govern the subsequent reactions to the founders of this field e.g. grignard ziegler gilman wittig and their followers the metal was critical the title of schlosser's book *polare organometalle* certainly was apt

presents the principles and applications of physical chemistry as they are used to solve problems in biology and medicine the first law the second law free energy and chemical equilibria free energy and physical equilibria molecular motion and transport properties kinetics rates of chemical reactions enzyme kinetics the theory and spectroscopy of molecular structures and interactions molecular distributions and statistical thermodynamics and macromolecular structure and x-ray diffraction
